"About 6:30 this morning, we smelled the smoke, and about 9:15, you could see the smoke coming out of the house," said a resident who lives near the scene, who requested anonymity. Firefighters responded after the house was on fire and the smoke was seen around 1:30 p.m., according to a Battalion Chief with the Beverly Hills Fire Department. The fire in the house was extinguished. No injuries were reported.

Bone scintigraphy--a method to detect metabolic bone disease. Since the introduction of technetium-99m MDP (methoxy-2-desoxypropyl-2-ethyl-l-thymidine-5'-monophosphate) bone scintigraphy, it has become a useful and easy to apply technique to detect metabolic bone diseases, such as osteoporosis and hyperparathyroidism, as well as skeletal metastases and infections. The aim of the present article is to describe the principles and potential for bone scintigraphy in metabolic bone diseases and to discuss the various aspects of bone scintigraphy.[Rapid quantification of trypsin inhibitor and cystatin C from human urine by an on-column enzyme-linked immunosorbent assay]. A quantitative method to detect the contents of trypsin inhibitor and cystatin C in human urine was established, based on the inhibition of the assay rate of the latex agglutination test by specific antibodies. The correlation between two-dimensional chromatographic profiles and the quantified results of trypsin inhibitor and cystatin C was good. The possible interferences in the urine were also explored. The proposed method is simple, fast, and accurate for the simultaneous quantitative analysis of urinary trypsin inhibitor and
