Ultimate Security, Total Security, Internet Security, Anti-Virus Premium, Anti-Virus Plus, Anti-Spyware and Anti-Virus, as well as K7 Netquestor which is not included with this application.

Regulation of somite development in avian embryos. The molecular regulation of somite development in the chicken is described. As previously reported for mouse, neurulation in chick begins with the formation of an anterior neural fold. Formation of somites begins at the level of the cardiac crescent and continues through gastrulation. Somites are initially loosely grouped along the entire anterior-posterior axis of the embryo,

but later undergo periodic waves of synchronous cell divisions to build up one somite at a time. This pattern of somitogenesis is regulated by two distinct morphogenetic events. The first is the formation of a pre-somitic mesoderm at the level of the cardiac crescent that lays down the primary longitudinal musculoskeletal fibers of the body wall. The second is a distinct set of highly ordered cell movements in the pre-somitic mesoderm that results in the synchronous splitting of the mesoderm into a proximal presomitic mesoderm and a distal presomitic mesoderm. The proximal presomitic mesoderm invaginates to form the som
