## RegAuditor PC/Windows [Latest 2022]

Platform: Windows License: Freeware File Size: 2.35 MB RegAuditor Review: Convenience, user friendliness and the easy to use interface Simple and intuitive, RegAuditor will surely be welcomed by users with little or no knowledge of computers. Once you install the software, you are greeted with a simple window displaying a summary of the current items on the computer, and with the option to launch the Windows Registry scanning procedure or get registry protection from a website. The screenshot below (click it to enlarge) shows the interface of the program on a test system, where no malware was found. Click the Start button on the right and you will see the status of the scanning process. There are three windows open at a time, the one on the left opens when you click the Start button, while the one in the center opens with the clicking of the Scan button on the top right. In the right window, you will see the description of the currently active scan. The name and description of the registry keys detected and the type of the threat are indicated next to each key. Highlights: A simple, intuitive and good looking interface, with a list of detected adware, spyware and other types of malware agents. You can set a key-value combination as a "safe" zone for the registry, with which you can set a certain directory to be excluded from scanning. After a scan is completed, you can automatically open a browser window with solutions suggested by the application. The system administrator can open the app in User Account Control (UAC) mode, so the user doesn't need to be logged in as an administrator. All registry keys that are defined as "dangerous" can be deleted with a click of a button, but all "unknown" and "safe" keys remain on the computer. The interface is English only. Screenshots: The interface of RegAuditor on Windows XP, where no malware was found. System requirements: Windows 7, Windows Vista or Windows 2000 or XP 1 GHz Processor 300 MB RAM Install guide: Using the installer, the program should be installed in the following order: 1. Go to the folder you downloaded the installer to (this is not the case here, so navigate to the folder you extracted the folder into).2.

## RegAuditor Download

===== RegAuditor scans the computer for dangerous threats. It lists them as they are detected. The list of results shows the registry path, value, type, file and description for each found threat. These items are color-coded: green means safe, yellow unknown, while red stands for dangerous - a pretty intuitive system. It is possible to register and unregister DLLs with one click. Note that RegAuditor cannot eliminate threats from the machine, as its purpose is simply scanning for malware. Clicking two buttons open up some web pages with solutions suggested by the app, though. In other words, it is highly recommended to install an all-around anti-malware application to remove found infections and detect future ones. The simple software program runs on a very low amount of CPU and RAM, so it does not put a strain on computer performance. Unfortunately, RegAuditor froze during Softpedia evaluation, right in the middle of scanning, on Windows 7 64-bit. Otherwise, we haven't found any issues. Aside from this aspect, the intuitive tool should especially please users with limited or no experience in computer software, thanks to the general simplicity.
