The CBT Calculator offers the same panel of features as the other modeling applications, but the display of the coverage areas was simplified to the horizontal or vertical and two zones - rather than three. This particular application was designed to render CBT Constant Beamwidth Technology Line Array (Column) speaker systems, and it's marketed as such. There are a couple of other applications available that will render as CBT-A Series. The Metamagic® series of guitar effects features a new synthesized unit, displaying an extremely powerful and musical signal to provide an interesting, expressive and engaging experience for the listener. With powerful effects such as sounds like a flanging or chorus effect, envelope generators, modulation of the sound and harmonics. The Metamagic guitar series will have everything your guitar needs to play in perfect harmony. Guitar Tone is created with circuitry, component and configuration using CV's and/or momentary buttons to create a variety of new sounds. The nuances and details of the sounds can be further enhanced by the ability to apply a variety of tremolo, phasing, and panning functions. You can use Elac's Booster 2.2 to feed your stereo system with any music you like. The latest version 2.2 of Elac Booster allows you to connect your guitar directly to your home stereo system via the AUX input. Which means you can plug in your guitar, without taking it out of its case or removing the strings from the guitar. Boost2, easily worked in any standard stereo amplifier. Access Booster 2.2 from the front panel of the amplifier, using the AUX input. Features of Elac Booster 2.2: - Transforms your amp into a high-quality speaker - Noise Reduction to keep it clean - Allows you to use both headphone jack and speaker - Takes up almost no space - Boost the full range of the amplifier - Connects to most standard home amplifiers - Metal structure - XLR (male) connectors and quarter inch (6.3) (T or R 6.3) inputs and outputs The Soutation Chromatic Smoothing (CS) Delay is a compact quality delay effect that delivers a lush wet, warm stereo delay effect, offering great flexibility in terms of delay time and feedback. The Soutation CS Deluxe features an easy to use control panel that offers nine delay types and nine feedback types, allowing you to create your own unique sound. If you are looking for a

The CBT Calculator from JBL is a precision engineering tool that allows you to design CBT Constant Beamwidth Technology (CBT) loudspeakers into a wide variety of venues. This calculator allows you to explore the vertical coverage, sound level capability, and evenness of coverage of either one or two CBT loudspeakers, set to various settings, in a room with up to 4 independent listening planes. The CBT Calculator shows the resulting SPL vertical coverage mapping of a proposed design, and computes the frequency response of up to 6 listener locations as well as an SPL summary of the microphone locations over user-defined frequency bands. It shows the sound level projection from the CBT loudspeakers. Colors correspond to the Sound Pressure Level (SPL) chart to the right of the Coverage Display. This display shows a Sectional View (ie, side view) showing the vertical coverage of the speaker within a room having one to four listening planes. More features and tools Up to 6 microphone locations can be defined on the Listening Plane(s). You can drag a speaker to a different location. All CBT models have a Music/Speech switch on them. It also displays the frequency response (from 100 Hz to 10 kHz) for each of the microphone locations that you've placed on the Listening Planes in the Coverage Display. Visualize a wide variety of CBT line array CBT devices with the JBL CBT Calculator. The application works by asking for various CBT specifications (vertical coverage, sound level capability, speaker coverage, etc.), the location of each speaker, and the characteristics of the room. After you have entered your CBT data, it will show you the resulting coverage and the corresponding audio quality in a graphical representation. ShapeMaker is a mathematical design program. It's a fast way of creating (and manipulating) mathematical equations that describe shapes. Each shape is modeled using a system of algebraic equations. With ShapeMaker you can create 3D solids, curves, surfaces, bezier curves, etc. In ShapeMaker you can play around with equations that describe a variety of mathematical shapes. From solids to triangles, ellipses, bezier curves, surfaces, you can create any number of shapes based on equations you enter. ShapeMaker is based on a dimensional analysis approach to programming. So it has a simplicity that makes it easy to learn. For experts, you can even write your own equations for curves and solids. ShapeMaker is a fast, easy, universal math program which helps you design anything you can imagine. New wave of programming languages using an entirely new technology for embedded programming. In 1991 the first generation of microcontrollers was introduced. At that time the market for these microcontrollers was very limited, as people weren't interested in using a 8-bit microcontroller for their projects. Ten years later, in 2001, a new generation of microcontrollers were introduced. These so called "low-power" microcontrollers are power efficient and offer far more than the first generation of microcontrollers did. The current generation of microcontrollers used in these tiny microcontroller modules are so powerful that you can now build systems that can be controlled by a human being. The massive use of these microcontrollers in small electronic devices, cars, toys, and everywhere else has created a huge demand for these microcontrollers and this demand is still growing. This is why you have the new wave of programming languages. New Wave of Programming Languages using an entirely new technology for embedded programming.
