Understanding Photoshop layers Photoshop is built around layers that can be stacked, clipped, or blended together to form one image. You can edit and combine layers to produce a final image that is usually more complex than the original that was created. In addition to layers, you can also view the image in its original form in a separate viewport. In general, your image should have a layer for every component that you want to draw attention to or hide. For example, a particular image might have a background layer. Elements like a logo could be arranged in a layer called a _layer mask_, which means that they appear on top of the background layer and are visible when you turn the logo layer mask to transparent (see the next section for an explanation of the layer mask in more detail). If you want to create effects with layers, Photoshop has a series of _filters_ that enable you to create a new type of layer to achieve a particular effect. If you want to produce a complex image, with multiple layers, you can use Photoshop's _image compositing_ functions to make the image look more visually interesting. This kind of manipulation is known as _image compositing_ because the different layers can be combined into a single image. Figure 2-2 shows some of the elements contained within a layer. The figure shows a layer containing an image, a layer containing an object to be moved, an eye tube layer, and a layer with the layer mask settings. FIGURE 2-2: Elements in a layer are visually attractive elements to the eye. Layers come in two sizes: pixels and points. A point represents a unit of size, which makes them easier to handle than pixels — for example, in the case of a click to transform. For example, when you draw a rectangle, Photoshop selects each visible point within that rectangular area and creates a layer that appears. The number of pixels represents the amount of space

The Gradient tool allows you to create a color palette by mixing two or more colors together. You can then apply the gradient to a range of pixels and use the gradient as a mask to copy, paste or remove some or all of the pixels. Favorites is a feature that you can use to save brush or pen settings for later use. This is useful if you want to use the same settings again. The Lasso tool allows you to quickly select the pixels that you want to edit. The Masking tool allows you to apply a filter that will let you edit only the selected pixels. This is useful for removing unwanted areas, such as shadows, from an image. The Paths tool allows you to create a selection of pixels using a series of points. You can then select any of the pixels in the path to select them all. Photoshop allows you to create virtually any type of effect. However, it will be necessary for you to experiment in order to find the effects you like best. For example, by using the Shadows and Gradients effect, you can easily create the effect of a moving sunrise. Photo Magic | Photoshop is a feature packed tool, but it is still fun to use. You can use all the tools by pressing the menu button, highlighted below, while you are using the tool. Some of the most important menu options are discussed in the video. You can easily scale and position a document, add or remove layers and adjust the properties of those layers. You can also create complex selection areas such as polygonal shapes and rectangles. You can use some advanced tools such as the Heal tool, which can be used to repair damaged areas in an image. You can change the contrast and brightness of the entire image, as well as the settings of the Color Balance tool. You can use the tool to erase a selected area, or you can apply filters or effects to create special effects. You can also use the Blur filter to create a smoky effect. Photoshop supports a multitude of graphic file formats such as TIF, JPEG, GIF, PNG, BMP and SWF. The 2D gradient tool is a clever way of applying color gradients. This is useful for creating effects such as blurring, adding movement or making an image look 3D. Effects |

Q: Facebook profile picture remove I'm using this to change my default profile picture FB.api({ method: 'fql.query', query: 'SELECT pic_big FROM user WHERE uid='+FBUserID }, function (data) { $('img#profile-image').attr('src', data[0].pic_big); }); But its not working for me. What am I doing wrong? Thanks! A: fql.query is meant to be used on a single Facebook user's wall, not a whole set of users. You must be trying to use it on the user's page. There's an example in the documentation that shows how to use it on a collection of user's wall (when using the /me/feed callback instead of fql.query)... Q: XSL Grouping/Parsing I'm looking for the best way to parse the following XML. There are many ToppingRecords that can be returned where there are multiple ToppingIds. For example 123 Topping 1 123 Top 1 234 Topping 2 234 Top 2
