More particularly, it relates to a non-contact power transmitter which can transmit an electric power without a contact with a power receiver. In general, the non-contact type power transmission system has a high transmission efficiency compared with the contact type power transmission system. And, thus, it has an advantage to transmit and receive an electric power between the power transmitter and the power receiver without contacting each other. As the non-contact type power transmitter, there is conventionally and widely known, for example, one shown in Japanese Patent Unexamined Publication No. 1-246051, where a power receiving coil unit is mounted on an electric unit, a power transmitter is provided outside the electric unit for transmitting an electric power with radio and a magnetic induction system is utilized for transmission. In the conventional system as mentioned above, the power transmitter sends an electric power, which is transmitted from a secondary side of a power transmitting coil, to a primary side of a power receiving coil through magnetic induction and the power receiver receives the electric power
