To describe the surgical and anesthetic aspects of major head and neck oncologic resection and reconstruction of the face, pharynx, tongue, and oral cavity. The authors' personal experience and the data from the literature. A MEDLINE and hand search were performed to identify studies and reports describing different techniques of major head and neck oncologic resection and reconstruction. Over the last 30 years, the authors and the surgical teams of many experienced surgeons have gained experience, and in recent years the introduction of new surgical techniques has helped change reconstructive strategies. There is now consensus as to the extent of surgical resection in selected cases. However, the optimal preoperative preparation remains a subject of discussion. The current review discusses some of the issues and conditions that affect preoperative preparation for major head and neck resection and reconstruction.Q: Windows Server 2008 R2 and LAMP stack I am currently hosting a ASP.NET site on my Windows Server 2008 R2, and I have Apache installed. However, the script that is running on the server uses the PHP scripting language and the IIS/Apache thing is too much for me. The site has been running great, but lately (month and a half ago) the site has been very unstable and slow. I just can't seem to figure out why. It is currently on a 1 gig static IP address. My question: What should I do about it? Should I look to switch my server from Windows to Ubuntu, or is there something else I could try that would work better?
