version: [Website] 1. Field of the Invention The present invention relates to a partition panel having an air-permeable structure and a method of assembling the partition panel. 2. Description of the Related Art Conventionally, portable electronic devices such as a portable computer, a note-type computer, a portable word processor, a mobile phone, and a small-sized digital audio player are widely known, and among them, for example, the mobile phone is mainly provided with an expandable capacity. Therefore, when a public telephone line is used by the user, the user may go out to deposit a phone in a call-processing device such as a telephone booth, and when the user desires to use the mobile phone again, the user may take the mobile phone out from the call-processing device. In this case, because the call-processing device is separated from the user, the user may lose track of the location of the call-processing device. Therefore, an apparatus, which is capable of informing the location of the call-processing device to a user, has been recently proposed. Japanese Laid-Open Patent Publication No. 2000-244283 discloses an apparatus, which is capable of informing the location of the call-processing device to a user. However, the apparatus described in Japanese Laid-Open Patent Publication No. 2000-244283 has a problem in that the operation of the apparatus is troublesome. As illustrated in FIG. 1, an apparatus 90 includes an antenna 91, a transmission antenna 92, a reception antenna 93, a microcomputer 94, a first antenna 95, a second antenna 96, and a storage device 97. The transmission antenna 92 and the reception antenna 93 are used to transmit and receive radio signals. The microcomputer 94 is connected to the transmission antenna 92 and the reception antenna 93, so that the microcomputer 94 is capable of controlling an operation of the apparatus 90. The first antenna 95 and the second antenna 96 are used to receive radio signals from a call-processing device, and the microcomputer 94 analyzes the radio signals received via the first antenna 95 and the second antenna 96. The storage device 97 stores information, such as a location of a call-processing device, which may be input through a button 99 or a key pad 98. In the apparatus 90, if a telephone user transmits a radio signal from the transmission antenna 92, the radio signal is received by the reception antenna 93, and is then transmitted to the microcomputer 94. In

1. Field of the Invention The invention relates to an electro-optical display device, and more particularly, to a liquid crystal display device in which a substrate provided with a gate line, a source line, a pixel electrode, a thin film transistor, and the like is divided into two and the divided substrates are overlapped and bonded to each other.

2. Description of the Related Art A technique for segmenting a plurality of pixels in a liquid crystal display device to provide each of the segmented pixels with a pixel electrode has been known. Specifically, a partition wall which extends along a source line, a gate line, or the like is provided on a substrate on which a thin film transistor is formed, and an end portion of each pixel is divided by the partition wall to form the segmented pixel. When the above-described pixel electrode is formed using a material such as metal, the pixel electrode comes in contact with an interconnect layer disposed on the partition wall. When the interconnect layer is formed of a conductive material such as aluminum (Al), the pixel electrode and the interconnect layer are often disconnected by the material of the interconnect layer or the step difference between the partition wall and the pixel electrode. In order to prevent the above disconnection, a technique which forms a semiconductive film of amorphous silicon (a-Si) or crystalline silicon (poly-Si) on a substrate and fills the aperture portion with an etching mask (which is usually referred to as a barrier layer) to prevent a disconnection of a pixel electrode has been known (see JP-A-5-316673, JP-A-2004-262941). However, in the above structure, when the barrier layer is filled in a gap between the partition wall and the pixel electrode, the aperture ratio is lowered. In order to solve this problem, a technique which fills a hole portion formed by removing the barrier layer of an area where the pixel electrode is to be formed in the partition wall, with the pixel electrode to make the hole portion smaller than the gap between the partition wall and the pixel electrode has been known. However, in the above structure, when the pixel electrode is formed using a material such as metal, the pixel electrode comes in contact with a metal layer disposed on the 6d1f23a050
